

EDAC Voice Diallers – Application Examples

EDAC Voice Alarm diallers can be connected to most common types of house security and fire alarms. When an alarm is triggered on the alarm panel the dialler will automatically dial a list of phone numbers and report the alarm conditions. Alarm messages are delivered directly to the most appropriate person involved. They can also be connected to many common types of machinery and process control applications ensuring that critical information is delivered on time, every time.

EDAC Voice diallers can be used to monitor and control various electrical appliances. One example might be an irrigation pump. The user can call the EDAC dialler up to switch the pump on or off. The EDAC dialler will give positive feedback ensuring you know that the action has occurred. The EDAC Dialler can also monitor the status of the pump ensuring that if any fault condition occurs the most appropriate person is notified in a timely manner.
